Progress

From the plan last week:

- Finalize and benchmark GBF
- Do some writing on the mitigations so far
- Continue with the Authorized MPSI mitigation (read some references of [11])

Progress

GBFs [10] adaptation to **Ruan et al. [6]** :

- Instead of the XOR of shares giving x : work in the same (multiplicative) group used by ElGamal, the shares are group elements
- Made a set with the indices generated by the hash functions to make sure that they are unique

Algorithm 1: $BuildGBF(S, n, m, k, H, \lambda)$

```
input  : A set S, n, m, k, λ, H = {h_0, ...h_{k-1}}
output: An (m, n, k, H, λ)-garbled Bloom filter GBF_S
GBF_S= new m-element array of bit strings;
for i= 0 to m − 1 do
    GBF_S[i]=NULL;                          // NULL is the special symbol that means ''no value''
end
for each x ∈ S do
    emptySlot = −1, finalShare= x;
    for i=0 to k-1 do
        j = h_i(x);                         // get an index by hashing the element
        if GBF_S[j]==NULL then
            if emptySlot ==−1 then
                emptySlot=j;                // reserve this location for finalShare
            else
                GBF_S[j] ←r {0,1}^λ;        // generate a new share
                finalShare=finalShare⊕GBF_S[j];
            end
        else
            finalShare=finalShare⊕GBF_S[j]; // reuse a share
        end
    end
    GBF_S[emptySlot]=finalShare;            // store the last share
end
for i= 0 to m − 1 do
    if GBF_S[i]==NULL then
        GBF_S[i] ←r {0,1}^λ;
    end
end
```

Progress

GBFs [10] adaptation to **Ruan et al. [6]** :

- Original Protocol:
  - The server multiplies the encrypted bins (encrypted 1's in the original protocol) with a blinded version of its element
  - Adds to the intersection if the decryption is the blinded element

Algorithm 1: $BuildGBF(S, n, m, k, H, \lambda)$

```
input  : A set S, n, m, k, λ, H = {h_0, ...h_{k-1}}
output: An (m, n, k, H, λ)-garbled Bloom filter GBF_S
GBF_S= new m-element array of bit strings;
for i= 0 to m − 1 do
    GBF_S[i]=NULL;                          // NULL is the special symbol that means ''no value''
end
for each x ∈ S do
    emptySlot = −1, finalShare= x;
    for i=0 to k-1 do
        j = h_i(x);                         // get an index by hashing the element
        if GBF_S[j]==NULL then
            if emptySlot ==−1 then
                emptySlot=j;                // reserve this location for finalShare
            else
                GBF_S[j] ←r {0,1}^λ;        // generate a new share
                finalShare=finalShare⊕GBF_S[j];
            end
        else
            finalShare=finalShare⊕GBF_S[j]; // reuse a share
        end
    end
    GBF_S[emptySlot]=finalShare;            // store the last share
end
for i= 0 to m − 1 do
    if GBF_S[i]==NULL then
        GBF_S[i] ←r {0,1}^λ;
    end
end
```

Progress

GBFs [10] adaptation to **Ruan et al. [6]** :

- GBF mitigation:
  - The server multiplies the encrypted bins (shares of 1) with a blinded version of its element
  - Adds to the intersection if the decryption is the blinded element

Algorithm 1: $BuildGBF(S, n, m, k, H, \lambda)$

```
input  : A set S, n, m, k, λ, H = {h_0, ...h_{k-1}}
output: An (m, n, k, H, λ)-garbled Bloom filter GBF_S
GBF_S= new m-element array of bit strings;
for i= 0 to m − 1 do
    GBF_S[i]=NULL;                    // NULL is the special symbol that means ''no value''
end
for each x ∈ S do
    emptySlot = −1, finalShare= x;
    for i=0 to k-1 do
        j = h_i(x);                   // get an index by hashing the element
        if GBF_S[j]==NULL then
            if emptySlot ==−1 then
                emptySlot=j;          // reserve this location for finalShare
            else
                GBF_S[j] ←r {0,1}^λ;  // generate a new share
                finalShare=finalShare⊕GBF_S[j];
            end
        else
            finalShare=finalShare⊕GBF_S[j];   // reuse a share
        end
    end
    GBF_S[emptySlot]=finalShare;      // store the last share
end
for i= 0 to m − 1 do
    if GBF_S[i]==NULL then
        GBF_S[i] ←r {0,1}^λ;
    end
end
```

GBF (2^-30)

GBF

Ruan et al. [3] results, **GBF Mitigation (RQ3)**:

(Average) Number of False Negatives for a run of the protocol involving various number of parties (including the server)
Set size clients: 256 elements

Set size server: 1024 elements
FP rate: 2^-7

Parties	Run 1	Run 2	Run 3	Run 4	Run 5	Run 6	Run 7	Run 8	Run 9	Run 10	Mean
2	0	0	0	0	0	0	0	1	0	0	0.1
5	0	0	1	0	0	0	0	0	0	0	0.1
10	0	1	1	0	1	3	2	1	2	0	1.1
20	1	2	3	0	2	0	4	2	1	0	1.5
30	3	1	3	2	3	2	3	5	1	0	2.3
40	3	5	2	3	2	1	2	3	1	4	2.6
50	3	1	4	2	3	3	3	5	5	3	3.2
100	6	10	7	3	8	5	9	8	5	6	6.7

Next Week

- Do some writing on the mitigations
- Continue on the authorized

Thank you!
